

SUMMARY OF RESEARCH

Whilst designing my different ideas of a storage system for a teenager's t.v and hi fi system, I found lots of other similar ideas on the market, these systems have plenty of room for improvement which I have experimented with.

For example television and hi-fi systems vary dramatically nowadays, and the systems on the market are very limited in terms of space for this. So, instead of making huge great areas for them (as this makes the system look too big and ugly) I designed my systems with shelves on top, this way there is no limit to the height of the t.v.

Also, a lot of the systems on the market are low, mainly designed for a family living room. In a teenager's

bedroom (like what my designs are for) the television becomes awkward to watch. So my designs are either tall, or, even better, hang on a wall (the height can be adjusted this way) so the television is more comfortable to watch.

Systems on the market also hold either a tv or hi-fi, not both. So (without making my system big and ugly) I made it fit as much as it could.
